

# Portable wood moisture meter PCE-MMK 1

Professional portable devices are indispensable for technicians and experts. Especially moisture meters to measure the absolute moisture in various materials need to work flawlessly and be compact and portable.

The universal moisture meter PCE-MMK 1 from PCE Instruments has been specially designed for portable use. The light-weight device which weighs just 100 g and its dimensions are 139 x 47 x 25 mm. It lies perfectly in the user's hand. The PCE-MMK 1 wood moisture meter fulfils all basic requirements for sales representatives who need to check the moisture of different materials. In addition to the absolute moisture in construction materials or wood, the universal moisture meter also shows the climate in the room, i. e. the ambient temperature and humidity. The display immediately shows a reference value in per cent. The user can see the percentage of moisture in the wall or in a certain material, which means that it is not necessary to convert any numbers. For wood, construction materials, paper and piles of cardboard, different penetration probes are needed. Three electrodes are included in the standard package. The wood moisture meter PCE-MMK 1 has four different modes of measurement which can be selected in line with the different probes. With the PCE-MMK 1, you can measure 130 different types of wood, 19 construction materials like cement, screed, mortar, concrete, etc. By means of the dry-moist indicator, a reference measurement can be carried out and an index mode can be created which allows conclusions on the absolute moisture. The universal moisture meter PCE-MMK 1 has a self-diagnostic function and can do a temperature compensation, which makes the measurement results even more accurate.
